

How will changing sediment fluxes alter the physical and ecological structure and function of Arctic rivers and streams?

Joel Rowland (jrowland@lanl.gov)

- Thaw, changing vegetation, and hydrology are altering how and where sediment enters stream and rivers
- Changes occur due to local conditions
- Local changes may propagate or dampen across watersheds
- System level changes depend on interactions across these scales

To address this challenge:

- Geomorphology
- Ecology
- Fisheries
- Hydrology
- Indigenous knowledge
