

2015 Sea Ice Outlook
June Report based on May Data

Bo Andersen, Norwegian Space Centre

I continue to use the same method based on the maximum area in spring at the relatively stable reduction fraction we have seen the last 8 years.

Based on the data produced by NERSC my prognosis for minimum value of the area for 2015 is 3.9 million square kilometers.

That implies just slightly more than the then record low of 2007.
